

# Class Fund Manager

## Teacher & Treasurer Manual

February 26, 2026

This manual covers every task a **teacher**, **Full Treasurer**, or **Bookkeeper** will need to perform in the Class Fund Manager. The application runs at:

<https://two025-wt-prj-dembinny.onrender.com>

## 12 Contact and Support

8

## Roles and Permissions

The system has six user roles. The table below shows which actions each role may perform.

| Role                        | Capabilities                                                                                                                                 |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| <b>System Admin</b>         | Full access to every class and every feature. Creates and manages class accounts.                                                            |
| <b>Treasurer Full</b>       | Full treasurer capabilities for their assigned class: payment requests, transactions, expenses, student management, bank account visibility. |
| <b>Treasurer Accountant</b> | Can manage payment requests and view the bank account, but cannot log expenses or manage students.                                           |
| <b>Treasurer Bookkeeper</b> | Can log expenses and record cash transactions, but cannot create payment requests or manage students.                                        |
| <b>Student</b>              | Views their own assigned payment requests, pays via QR, sees their own transaction history.                                                  |
| <b>Parent</b>               | Views the same payment data as their linked child.                                                                                           |

**Fund Groups** are custom permission sets you create inside the Admin Panel (see Section 9). A Fund Group acts like a named role for your class — useful when you want a subset of treasurer abilities for class representatives without giving full treasurer access.

## Logging In

Navigate to <https://two025-wt-prj-dembinny.onrender.com/login/> and enter your **username** and **password**. After a successful login you are redirected to the Dashboard appropriate for your role.

If you forget your password, contact your System Admin — there is no self-service password reset in the current version.

## Dashboard Overview

The Treasurer Dashboard is your home screen. It shows:

- **Fund Balance** — total collected minus total expenses (Collected: sum of all confirmed transactions; Spent: sum of all logged expenses).
- **Payment Requests** — a list of active requests with how many students have paid ( $N/Total$ ).
- **Recent Expenses** — the most recent expense records.
- **Quick links** — navigate to Expenses, Import, or Admin Panel.

**Important:** The “Fund Balance” displayed in the top navigation bar respects the `hide_fund_balance` flag on each student’s account. If a student has this flag set, they cannot see the fund total.

## Bulk Importing Students (CSV)

The fastest way to populate your class roster is to upload a CSV file. Only users with **Treasurer Full** or **System Admin** privileges can access the importer.

## How to navigate to the importer

1. From the Dashboard click **Import Students**.
2. Select your **Class** from the dropdown.
3. Upload the **.csv** file and click **Preview Import**.
4. Review the preview table — green rows will be created, red rows have errors and will be skipped.
5. Click **Confirm Import** to apply all valid rows.

## CSV format and column reference

The file must be **UTF-8 encoded** and include a **header row**. Column names are case-insensitive and leading/trailing spaces are ignored.

| Column                   | Required?       | Notes                                                                                                                                                                                                                                |
|--------------------------|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>username</b>          | <i>see note</i> | Login name used for authentication.                                                                                                                                                                                                  |
| <b>email</b>             | <i>see note</i> | Student email. When no username is given, the local part (before @) becomes the username.                                                                                                                                            |
| <b>first_name</b>        | <i>see note</i> | First name. Used together with <b>last_name</b> to derive a username when neither username nor email is provided (e.g. “Jan Novák” → “jnovak”).                                                                                      |
| <b>last_name</b>         | Optional        | Last name. Stored on the user account.                                                                                                                                                                                               |
| <b>role</b>              | Optional        | One of: <b>student</b> , <b>parent</b> , <b>treasurer_full</b> , <b>treasurer_accountant</b> , <b>treasurer_bookkeeper</b> , or any <b>Fund Group name</b> you have created for this class. Defaults to <b>student</b> when omitted. |
| <b>variable_symbol</b>   | Optional        | Payment identifier (5 digits). Auto-generated from the class prefix if blank.                                                                                                                                                        |
| <b>parent_email</b>      | Optional        | If provided, a Parent account is created (or found by email) and linked to this student.                                                                                                                                             |
| <b>parent_first_name</b> | Optional        | First name stored on the Parent account.                                                                                                                                                                                             |
| <b>parent_last_name</b>  | Optional        | Last name stored on the Parent account.                                                                                                                                                                                              |
| <b>password</b>          | Optional        | Sets the initial password. A random 12-character password is generated if blank. Communicate the password to the user separately.                                                                                                    |

**Identity rule:** Every row must supply *at least one* of: **username**, **email**, or both **first\_name** and **last\_name**. Rows that have none of these are rejected.

## Minimal CSV example

```
first_name,last_name,parent_email
Jan,Novák,jan.novak.otec@example.cz
Marie,Horáková,horak.maminka@example.cz
```

## Full CSV example with all columns

```
username,email,first_name,last_name,role,variable_symbol,
```

```
parent_email,parent_first_name,parent_last_name,password
jnovak,jan.novak@skola.cz,Jan,Novák,student,04001,
jan.novak.otec@example.cz,Petr,Novák,tajne123
mhora,,Marie,Horáková,student,,
horak.maminka@example.cz,Eva,Horáková,
```

**Note:** Lines are wrapped here for readability. In the actual file each row must be a single unbroken line.

### What happens on import?

For each valid row the system:

1. Looks up an existing user by **username** → **email** → first+last name. Creates a new user if none is found.
2. Sets the user's **role**. If the role matches a **Fund Group** name, the user is created as a **TREASURER\_BOOKKEEPER** and added to that group.
3. Generates a **Variable Symbol** if not supplied (format: <2-digit class prefix><3-digit sequence>).
4. Creates or links the **Parent account** if **parent\_email** is present.
5. Records the import in the ImportJob log for audit purposes.

## Creating a Payment Request

---

Payment Requests tell students and parents what they owe and by when.

1. Navigate to **Finances** → **Payment Requests** → **New Request**.
2. Fill in:
  - **Title** — e.g. "School Trip to Prague".
  - **Amount** — decimal, e.g. 450.00 CZK.
  - **Due Date** — students see this deadline.
  - **Assign to all** — tick to assign every active class student automatically. Untick to choose specific students from the list.
  - **Variable Symbol** / **Specific Symbol** — optional; helps match bank transfers if used.
3. Click **Save**. The request is immediately visible on every assigned student's dashboard.

A SPAYD QR code is automatically generated for each student using their personal Variable Symbol. See Section 8.

## Recording Transactions

---

### Manual cash payment

Use this when a student brings cash in person.

1. Open **Finances** → **Payment Requests** and click the relevant request.
2. Find the student in the list and click **Record Cash Payment**.
3. Enter the amount received (may be partial).
4. A transaction is created with status **PENDING**.
5. Click **Confirm** to mark it as received. The student's dashboard immediately shows it as paid.

## Bank transfer (planned)

The system is designed to import bank transactions automatically from a Fio Bank account. This feature is **not yet live** — matching is planned to use the student's Variable Symbol. Until then, all bank transfers must be confirmed manually as cash payments.

## Transaction statuses

| Status    | Meaning                                        |
|-----------|------------------------------------------------|
| PENDING   | Recorded but not yet confirmed by a treasurer. |
| CONFIRMED | Payment accepted; contributes to fund balance. |
| REJECTED  | Declined (wrong amount, bounced, etc.).        |

## Logging an Expense

Expenses reduce the displayed fund balance and give parents transparency into where the class money is spent.

1. Navigate to **Finances** → **Expenses** → **New Expense**.
2. Fill in:
  - **Title** — what was purchased.
  - **Amount** — decimal, e.g. 2500.00 CZK.
  - **Category** — one of: Trip, Supplies, Food, Decoration, Donation, Other.
  - **Spent at** — date of the purchase.
  - **Publish** — tick to make the expense visible to students and parents in their dashboard.
3. Click **Save**.

Expenses are shown in the treasurer dashboard; published expenses also appear in the student/parent view.

## SPAYD QR Codes

Each payment request page displays a QR code in the **SPAYD format** — the Czech banking standard for mobile payments.

When a parent scans the QR code with their banking app:

- The class bank account number is pre-filled.
- The payment amount is pre-filled.
- The student's **Variable Symbol** is pre-filled.

This means the bank transfer can be matched to the correct student automatically once bank import is activated. Parents never need to type account numbers or symbols manually.

The QR codes are generated server-side and embedded directly in the page as Base64 PNG images — no external service is contacted.

## Managing Classes and Users (Admin Panel)

The Django Admin Panel at [.../admin/](#) is accessible to **System Admins** only.

## Creating a new class

1. **Admin** → **Accounts** → **School Classes** → **Add School Class**.
2. Set **Name** (e.g. "4A"), **Teacher**, **School Year**, and **VS Prefix** (a 2-digit number uniquely identifying the class for Variable Symbol generation — e.g. 04).
3. Save.

## Creating a Fund Group

Fund Groups let you assign custom treasurer sub-roles to users (e.g. a class representative who can log expenses but not manage payment requests).

1. **Admin** → **Accounts** → **Fund Groups** → **Add Fund Group**.
2. Select the **Class**.
3. Enter the **Name** — this name can be used as the **role** column value in CSV imports.
4. Tick the **permission flags** that apply to this group:
  - *Can log expenses*
  - *Can manage payment requests*
  - *Can view bank account*
  - *Can manage students*
5. Save.

## Adding or editing a Class Membership

A **Class Membership** links a user to a class and optionally assigns them a Fund Group.

1. **Admin** → **Accounts** → **Class Memberships** → **Add**.
2. Choose **User**, **School Class**, and optionally a **Fund Group**.
3. Save.

## Managing the Bank Account record

1. **Admin** → **Finances** → **Bank Accounts** → **Add**.
2. Link to a **School Class** (one active bank account per class).
3. Enter **Account Number**, **IBAN**, **BIC**, **Bank Name**, and **Owner Name**.
4. Tick **Is Active** and Save.

## Viewing the Notification Log

---

Every email sent by the system (welcome messages, payment reminders, receipts) is stored in the **Notification Log**:

1. **Admin** → **Communications** → **Notification Logs**.
2. Use the filters on the right to narrow by *type* or *recipient*.
3. Each record shows the recipient, type, timestamp, and the rendered message body.

This log is read-only — it is an audit trail, not a re-send queue.

## Common Troubleshooting

---

| Problem                                     | Solution                                                                                                                                                                        |
|---------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| A student cannot log in.                    | Check their username in Admin → Accounts → Users. Reset the password from the user's edit page.                                                                                 |
| Import shows all rows as errors.            | Ensure the file is saved as <b>UTF-8</b> (not UTF-16 or Windows-1250). Each row needs at least username, email, or first+last name.                                             |
| Fund balance looks wrong.                   | Confirm that all cash transactions have been set to <b>CONFIRMED</b> status. PENDING transactions are not counted in the balance.                                               |
| QR code does not appear.                    | The class must have an active Bank Account record (see Section 9). Without an IBAN, no QR can be generated.                                                                     |
| A student has no Variable Symbol.           | Open <b>Admin</b> → <b>Accounts</b> → <b>Student Profiles</b> , find the student, and click <b>Regenerate VS</b> . Make sure the class has a non-empty <code>vs_prefix</code> . |
| The site shows “502 Bad Gateway” on Render. | The free Render plan spins down after inactivity. Wait 30–60 seconds for the dyno to wake up, then refresh.                                                                     |

## Contact and Support

This project is maintained as a school web-technologies assignment. For bug reports or feature requests open an issue on GitHub:
